

Mr. Jeong-seob from MOGAM states:

"NucleoCounter is fast and correct. That is why I purchased it. To get recombinant CHO cell that produce target protein, at early step I handle a lot of clones. In order to obtain the cell which produce the target proteins the best effectively, at the first step it is required that correct cell counting for seeding. Quick counting is essential to handle with many cell lines, so Nucleocounter is suitable for my experiments. I don't need to handle dye and can count low numbers of cells exactly using NucleoCounter. It is useful to counting the cells even though cell concentrations is very low. And it is so compact to use in cell culture room, that helps also to save time. Saving counting time at general animal cell culture makes little damage to the cells. Nucleocounter has many advantages for animal culture."
